The skeletal system consists of bones and their associated connective tissues, including cartilage, tendons, and ligaments. It consists of dynamic, living tissues that are capable of growth, detect pain stimuli, adapt to stress, and undergo repair after injury.

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

The Skeletal System The branches of science that will help you understand the body parts and functions are anatomy and physiology. Anatomy deals with the study of the human body (the components, structure and position) and physiology the study of how the body functions.

Physiology - Skeletal System -
BrianMac

The skeletal system is the body system composed of bones, cartilages, ligaments and other tissues that perform essential functions for the human body. Bone tissue, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the internal support structure of the body. In the areas of the skeleton where whole bones move against each other (for example, joints

Bone, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the support structure of the body. In the areas of the skeleton where bones move (for example, the ribcage and joints), cartilage, a semi-rigid form of connective tissue, provides flexibility and smooth surfaces for movement.

Skeletal System Anatomy and Physiology - SlideShare

The musculoskeletal system consists of bones of the skeleton, the joints and the skeletal muscles. It provides form, support, stability, and movement to the body. The musculoskeletal system's functions include supporting the body, allowing motion, and protecting vital organs.

Indeed humans are fortunate to have the entire skeletal system because it fulfills many important functions in the body. The skeletal system protects the soft tissues and vital organs; enables easier locomotion and serves as a framework as it shapes and supports the entire body.

Skeletal system 1: the anatomy and physiology of bones Author Jennie Walker is principal lecturer, Nottingham Trent University.

Abstract The skeletal system is formed of bones and cartilage, which are connected by ligaments to form a framework for the remainder of the body tissues.

Skeletal system 1: the anatomy and physiology of bones

Grows into and replaces cartilage.

Primary growth center: bones develop in diaphyses (cartilage Rod) Cartilage is removed as bone is created by osteoblasts and replaced with bone on the diaphyseal surface of the plate.

Secondary growth center develop in the epiphyses of the bone.

Intramembranous Bone Formation.
